

Vlad-Mihail Mureșan

SENIOR KOTLIN | JAVA FULLSTACK DEVELOPER

Independent contractor (PFA)

Full-stack engineer with 10 years in Java and Kotlin, spent mostly on systems where the numbers have to be right — trading, payments, billing, invoicing, and tax. I take a feature from the data model through the API to the screen on top, and I work out what it should do by talking to the business side rather than waiting for a spec.

Pub/Sub 1 yr

Testing

Mockito + JUnit 5 yrs

Playwright 3 yrs

EXPERIENCE

Senior Full-Stack Kotlin | Vue Developer

Mar 2026 — Present

EDEKA Bank · Building B2B Merchant Management & E-Commerce Platform

The client is the banking arm of one of Germany's largest food retail groups. The platform handles merchant onboarding, billing, and payment operations across a set of cloud-native services on GCP.

Team of five full-stack developers and two product managers · around 700 merchant invoices a month

Notable projects

- **Merchant Management Platform** — Building a comprehensive B2B platform for merchant onboarding, management, and administration. Developing scalable frontend interfaces with Vue 3 and TypeScript, while implementing backend services using Kotlin and Spring Boot.
- **Financial Services & Payment Integrations** — Delivering billing automation, payment processing workflows, SEPA integrations, and KYC compliance features to support secure financial transactions and regulatory requirements.

Main activities

- Taking features end to end — schema, service, API, and the Vue screen on top — instead of handing off between teams.
- Agreeing scope and API contracts with the product owner and the architect before implementation starts.
- Building the asynchronous flows between services on Google Pub/Sub, including what happens on retry when a downstream service rejects an event.
- Reviewing pull requests on both the Kotlin and the frontend side.

Backend: Kotlin, Spring Boot, Microservices, REST APIs, Pub/Sub

Frontend: Vue 3, TypeScript

Cloud & Infrastructure: Google Cloud Platform (GCP)

Senior Full-Stack Kotlin | Java Developer

Jan 2023 — Present

MHP · Invoicing, billing, and tax for the Volkswagen Group

MHP is the management and IT consultancy of the Porsche group. The work runs together with Volkswagen, on the systems that handle invoicing, billing, and tax across the Group's brands.

Around 900 subscriptions processed a day · team of three developers and an architect, with a PM and requirements engineers

Notable projects

- **ART MonetizationKit** — The integration product behind invoicing, billing, accounting, and tax for the Volkswagen Group. It exposes API endpoints that handle subscription and purchase data and routes it to the third-party systems that need it.
- **SDAC** — Two projects centered on issue-ticket management for MHP's customers.

Main activities

- Leading the team day to day — keeping people unblocked, and covering the architect role when missing.
- Designing new components and reviewing the ones the rest of the team builds.
- Owning the retry path for billing events on SQS — idempotency keys so a redelivered message can't bill twice, dead-letter queues for what keeps failing, and a replay endpoint the operations team uses to clear them.
- Discussing trade-offs and timelines directly with the client's business side.
- Interviewing candidates for open positions.

Backend: Kotlin, Java 17, Spring, Hibernate, PostgreSQL, OpenAPI, Kotest, Cucumber

Messaging: AWS SQS with dead-letter queues

Frontend: Angular, PrimeNG, TypeScript

Misc: SAFe, Git, GitHub, GitHub Actions, Postman, Bruno

Senior Full-Stack Java Developer

Oct 2016 — Present

Quick Suite Trading · Trading platforms, internal tools, and the authentication stack

The client builds trading technology for clearing and trading firms — order entry, market data, and the back-office systems behind them.

Notable projects

- **QTAG-Keycloak** — Migrating the company's in-house login into Keycloak: custom authenticator SPIs in Java that call internal services over HTTPS, custom Freemarker login themes, and support for biometric and passkey sign-in across realms.
- **Bursa Malaysia** — Developed a proxy application in Node.js using the Playwright framework, serving as a conduit between applications in our ecosystem and the Bursa Malaysia trading platform, so that users could execute trades as if they were interacting with it directly.
- **Lite** — A web trading platform with real-time streaming futures and options quotes. On it since day one, when it was me and my team leader; today it carries the full order flow and the information traders work from.
- **Products Tool** — An internal project consisting of various modules that display information about the Products database, the oldest database in the company.
- **QST-Careers** — The official job portal of Computers Voice Systems: a centralized hub for job seekers to apply across different domains and for company administrators to create job listings.

Main activities

- Sole developer on most of these projects — database design, backend, frontend, deployment, and the maintenance afterwards.
- Gathering requirements straight from the business side and turning them into a working system, without a spec handed down.
- Fixing security issues across Java dependencies, Dockerfiles, and Kubernetes manifests.
- Writing the documentation other teams and clients work from.

Backend: Java, Spring, Keycloak (custom SPIs, Freemarker themes), Node.js

Frontend: TypeScript, Angular

Misc: Docker, Kubernetes, GNU/Linux, Playwright, Git

Full-Stack Engineer

May 2025 — Aug 2025

SITA · Environmental assessment tooling for aviation

SITA builds IT and communications systems for the air transport industry. The work sat in the R&D team: EU rules currently account for CO₂ alone, and the research looked at how to measure the wider climate impact of a flight.

Main activities

- Turned research on non-CO₂ climate effects into tooling the business side could run itself.
- Built both ends of it — Spring services and the Angular screens on top.

Backend: Java, Spring

Frontend: Angular, TypeScript

Full-Stack Engineer

Nov 2023 — Mar 2024

Zyter|TruCare · Angular modernization of a care-management platform

The client runs a care-management platform used by healthcare providers, in production throughout the work.

Main activities

- Led the frontend upgrade from Angular 8 to 14 — six major versions on a platform that could not go offline for it.
- Built new components on the upgraded frontend, and fixed backend bugs affecting stability.

Backend: Java, Spring Boot

Frontend: Angular, TypeScript

Full-Stack Go Developer

May 2023 — Nov 2023

Swisscom · Design new services

The client is the largest telecommunications provider in Switzerland.

Notable projects

- **Voting app** — Allows customers to create and vote for issues they want implemented by Swisscom.
- **Exotrack** — Monitoring application for clients' infrastructure.
- **Service catalog** — Offers customers the possibility to choose between different customizations and plans for VMs and dedicated servers.

Main activities

- Owning the frontend architecture for three new services, built on Swisscom's own design system.
- Working on the Go backend as well, so the API shape was settled in one place instead of between two teams.
- Cutting the work into tasks, estimating it, and delivering on the agreed dates.

Backend: Go, Gin, MariaDB, Docker

Frontend: TypeScript, Vue.js 3, SDX components

Senior Java Developer

Apr 2022 — Jun 2023

Dufry · Design and rewrite of a new service

The client is a global travel retailer with operations in over 65 countries.

Notable projects

- **Assortment Management** — Responsible for the maintenance and operational support used to plan product selection and quantities across various shops.
- **Local Extensions** — Involved in the architecture design of the service database and Java structure by rewriting a section of the Assortment Management application.
- **Purchasing Order Management** — Developed and performance-tuned a purchasing control portal that facilitates the weekly purchase proposals for all companies within the group.

Highlights

- Improved performance by up to 800% on various endpoints by rewriting Java logic and SQL Server queries.
- Resolved a set of security issues by upgrading all third-party libraries.

Main activities

- Designed the service database and Java structure for the rewrite, and drew the flows the team then worked from.
- Split the rewrite into tasks, assigned them, and reviewed the pull requests.
- Mentored two interns and left behind written and video documentation.

Backend: Microservices, Java 17, Spring, SQL Server, Docker, REST APIs, JUnit/Mockito

Misc: Git, GitHub, DevOps, Azure, draw.io

Full-Stack Web Developer

Nov 2021 — Mar 2022

KeborMed · Design a proof of concept

The client is a startup in the healthcare industry, transforming medical hardware manufacturers into integrated solution providers.

Notable projects

- **KRONIQX** — Allows healthcare providers to build their own RPM solution from pre-built modules that can be customized to fit any organization's exact needs.

Main activities

- Built the proof of concept on my own — database, backend, frontend, deployment.
- Reported to the CEO directly and presented the results to prospective customers.

Backend: Microservices, Kotlin, Spring Framework, Azure SQL, Docker, REST APIs, Protobuf, gRPC, Mockito/JUnit

Frontend: TypeScript, Angular 13, Angular Material, Keycloak

Misc: Bitbucket, Git, GNU/Linux, Jira, Confluence, draw.io

Senior Java Developer

Jul 2021 — Jan 2022

Luxoft · Data pipeline feeding autonomous-driving models

The client is a global digital transformation company offering software development and IT solutions for complex digital challenges.

Notable projects

- **aws-proserve-partner-dx** — Handles conversions of data between different video formats and more, feeding AIs for self-driving cars for clients such as Audi, BMW, Volkswagen, Continental, and Mobileye.

Main activities

- Picked features up directly from the product owners and shipped them into a system already in production.
- Added modules on top of AWS DynamoDB and kept the existing ones running.

Backend: Java 11, Google Guice, DynamoDB, AWS, Docker, REST APIs, Mockito/JUnit

Misc: Bitbucket, Git, Jira, Confluence

EDUCATION

Master's Degree in Advanced Computer Science

2019 — 2021

University „Aurel Vlaicu" · Arad

Bachelor's Degree in Computer Science

2016 — 2019

University „Aurel Vlaicu" · Arad
